Figures	xvii
Tables	xxi
Acronyms	xxiii
Variables	xxvii
1. Introducing network centrality for strategic transportation network design	1
1.1. Emphasizing the role of network centrality in transportation network design	3
1.2. Structure of the thesis	4
2. Transportation networks and their optimal design	9
2.1. Transportation	9
2.2. Transportation networks	13
2.2.1. Network types	15
2.2.2. Transporting cargo or passengers	20
2.2.3. Creating efficiencies in transportation networks	22
2.3. Optimal transportation network design - an Operational Research perspective	27
2.3.1. Graph theoretic terminology for network design	29
2.3.2. Strategic decisions for network design	30
2.3.3. Tactical decisions for network design	34
2.3.4. Operational decisions for network design	39
2.3.5. Service-oriented aspects of OR network design	40
2.3.6. Performance indicators for transportation networks	42
2.4. Trade-off identification as an alternative perspective on network design	44
2.4.1. Empirical challenges for optimal network design	44
2.4.2. Trade-offs in network design	47
2.5. Enriching optimal network design with qualitative aspects	50
3. Transportation network centrality	53
3.1. Network topology and concentration as dimensions of network centrality	53

3.2. Impact of network centrality on network performance	59
3.2.1. Consolidation	60
3.2.2. Link frequency	62
3.2.3. Transportation distance and time	63
3.2.4. Schedule reliability	65
3.2.5. Network vulnerability	67
3.2.6. System capacity flexibility	69
3.2.7. Cost	71
3.2.8. Summarizing network centrality and its relation to network performance	72
3.3. Centrality measures in networks	74
3.3.1. Freeman's centrality framework	75
3.3.2. Measures of inequality in social groups	78
3.3.3. Measures of market concentration	80
3.4. Measuring network centrality of passenger airline networks	81
3.4.1. Assessing the outcome of deregulation	82
3.4.2. Metrics for the centrality of passenger airline networks	84
3.5. The role of network centrality in strategic network design	93
4. Less-than-truckload network centrality	95
4.1. Logistics service providers	95
4.1.1. Markets for logistics service providers	96
4.1.2. Categorizing logistics service providers	97
4.1.3. Research topics related to logistics service providers	100
4.2. Less-than-truckload transportation	102
4.2.1. Less-than-truckload characteristics	102
4.2.2. Less-than-truckload operations	103
4.2.3. European less-than-truckload market	105
4.2.4. Services accompanying less-than-truckload transports	105
4.3. Measuring less-than-truckload network concentration	107
4.3.1. Similarities of airline and less-than-truckload networks	108
4.3.2. Traffic flows in less-than-truckload networks	109
4.3.3. McShan-Windle index	110
4.3.4. Network concentration index	110
4.3.5. Hubbing concentration index	114
4.3.6. Comparing the indices	115
4.4. Relevance of measuring less-than-truckload network concentration for network design	118

5. An algorithm for less-than-truckload network design	119
5.1. Algorithm specifications	120
5.1.1. Stable overall transportation time in a less-than-truckload network	120
5.1.2. Centrality-driven network design	122
5.1.3. High level specifications for network generation	124
5.2. Input and output	129
5.2.1. Input	129
5.2.2. Cost and transport time assumptions	130
5.2.3. Parameters	131
5.2.4. Type of generated output	132
5.3. Assembling the algorithm	135
5.3.1. Trade-off direct vs. indirect: Separating direct and indirect traffic	136
5.3.2. Terminal allocation: Defining the number of hubs	140
5.3.3. Number of transshipments: Ensuring full connectivity	142
5.3.4. Demand estimation: Determining the right number of vehicles	143
5.3.5. Testing the generated network	145
5.3.6. Possible enhancements	146
5.4. The bigger picture: Contributions to strategic network design	149
6. Generated networks and their performance	153
6.1. Case study	154
6.1.1. Input and parameters to the algorithm	154
6.1.2. Generated results on stable transportation time	158
6.1.3. Generated results on cost	160
6.1.4. The role of network centrality for the case study	161
6.2. General Insights	164
6.2.1. Minimal frequency	165
6.2.2. Maximal accumulating days	167
6.2.3. Distance-related transportation cost	172
6.2.4. Percentage of sold empty capacity	172
6.2.5. Daily distance by vehicle	175
6.2.6. The impact of the potential hubs in the network	176
6.2.7. Summarizing the most influential findings	182
6.3. Indicators of network centrality to compare networks	183
6.4. The benefit of including network centrality in the network design process	188
7. Closing remarks	193
A. Appendix	199
